

\* Software Development is Iterative  
Can't solve everything in the beginning  
& Conversation

\* Infinite Scroll → Computers are finite making  
its memory, processing cycle etc.  
& resources

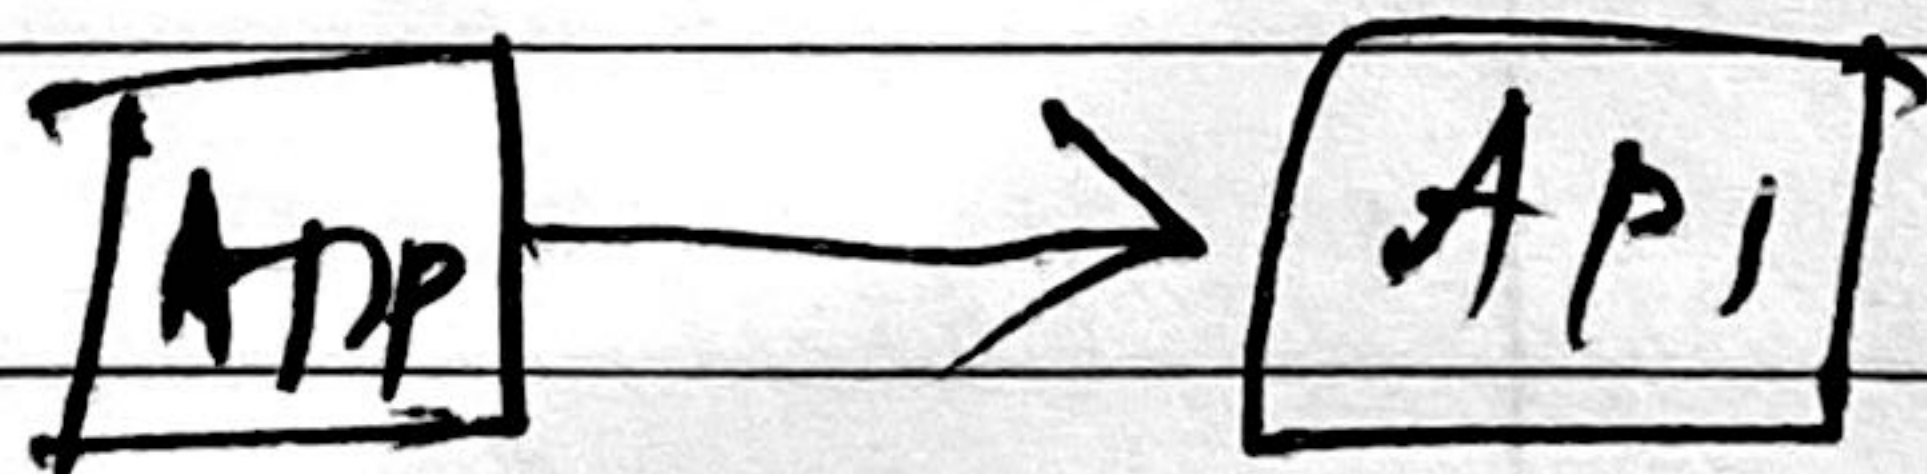

~~\* App needs~~

\* App needs data → Communicate with Backend  
→ Api calls → Data plans → Battery  
→ Money (customer)

\* Cache to save Api calls, Cache → Ram memory  
~~store data~~ Cache data wisely  
Cache - Memory Disk, Cache invalidation  
\* Can't cache everything its costly

\* App shouldn't make unnecessary Api request  
Circuit breaker - Don't keep retrying if Api fails

\* Start Simple like

\* Gets the content Text, Video, Image, Audio etc.

If binary size is more, use file system to store

Don't store credentials in the app  
You can store them as tokens, or store in
